```
encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64356) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a colymucleotide of the invention, and the invention and immune response specific for a P. acnes polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared via this method; a vaccine composition (comprising P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting method for inhibiting the development of P. acnes in a patient, and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymucleotides are useful for diagnosing, preventing or treating acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the sequence represents a specifically claimed P. acnes polypeptide which is sequence represents a specifically claimed P. acnes polypeptide which is this patent did not form part of the printed specification, but was this patent did not form part of the printed specification, but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to new POLYX nucleic acid useful for preparing a composition for treating or preventing tumour or inflammatory disorder. The invention is useful as vaccine and in gene therapy. The nucleic acid is useful for preparing a composition for treating or preventing e.g., tumour or inflammatory disorder. The present sequence is human syntaxinlike protein (POLYIS)
                                                                                                                                                         Human, tumour; inflammatory disorder, vaccine, gene therapy, cytostatic,
syntaxin-like protein, POLY15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New POLYX nucleic acid, useful for preparing a composition for treating or preventing e.g., tumor or inflammatory disorder.

The invention relates to an isolated mucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the mucleic acid inhibites proliferation of a call. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway the gene product or that has an activity against a biological pathway in which a proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies

```
or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underspressed; (12) determining the extent to which each of the strains is present in a culture or collection of trains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation to isolate eachdidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. arreus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at (ftp.wipo.int/pub/published_pot_sequences)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7

contines against P. falciparum infection comprising (I) or (II). (I) and collocation of a vaccines against P. falciparum confidence of a monoclonal articled relation. (I) and polyclocal antisers or a monoclonal articled relation. (I) and polyclocal antisers or a monoclonal articled rection confidence comprising the sequences of (I), are useful in the detection of immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rights or secreted or membrane proteins (I) (especially when they are rights or secreted or membrane proteins) of the identify drug resistance in P. falciparum. Sequencing of the conceded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and conceded by it will help to expand our understanding of parasite hology, a process hampered by the complexity of the parasitic lifecycle, and crugs and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 crepresent nucleotide and protein sequences given in the present creamence convenience of invention, but which are not specifically mentioned within the present creamence of invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                            9

                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence corresponds to a Plasmodium falciparum strain KI prescribing to a sequence was isolated by accening a P. falciparum strain 19/96 library with serum from a missionary treated by prophylaxis (for strain 16/96 see IRB9101286). Of 20 clones isolated, clone 7295 was used to screen a library generated from Thai strain KI. One clone contained a 6.85 kb insert including the generate sequence AATY8867. The gene comprises a 1.8 kb region encoding 3 major blocks of tetrapeptide repeats (especially the amino acids sequence VES, VEBN, VESI, VAPS, VAPT, etc) and a 3' hydrophobic region corresponding to a glycosyl-phosphatidyl-inositol membrane anchoring sequence. The invention relates to new polypeptides of the peptides AAW24791-4. The iSA-3 protein with the exception of the peptides and as vaccines for immunotherapy of malaria

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             and a protective liver-stage antigen (LSA), or its immunogenic fragment, from a human malaria parasite, where LSA is a fragment of LSA-3, then (1) is not montanide. The vaccine is useful for treating or preventing malaria, specifically where caused by Plasmodium falciparum. The vaccine is formulated in SBAS2 adjuvant, an oil-in-water emulsion containing QS21 and 3D-MPL (de-O-acylated monophosphoryl-lipid A, the combination of which results in strong induction of a circumsporoacie protein-specific cytocoxic T cell response, which is not generally induced by vaccines based on recombinant proteins, and synergistically increases production of gamma-interferon. This is the amino acid sequence of the liver-stage antigen-3 (LAS-3) from the Plasmodium falciporum strain K1 used to develop the recombinant proteins for the vaccine. (Updated on 07-AUG-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   82 KOMKROGDANVKGEEGIVKAHLLIGVHDDIVSMEYDLAYKLGDLHPTTHVISDIQDFVVA 141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ğ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a vaccine comprising a Th1-inducing adjuvant (I)

(I) is useful as hybridisation probes, polymerase chain and in reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 20; SEQ ID NO 55971; 103pp; English

Sequences AAF21614 - AAF22031 represent DNA sequences encoding human proteins ABES9714 - AAB59128. The DNA and protein sequences are associated with breast and overrian cancer. Included in the invention are sequences AAF22032 - AAF22040 and AAB59129 which are used in the invention and characterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive; nootropic; neuroprotective; antivital; antiallergic; hepatotropic; antidabetic; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The mucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic polymucleotide, a host comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence
of immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulecrative colitis; cardiovascular disorders such as myocardial ischaemias; wound healing; neurological diseases such as cerebral anoxia and epilepsy; and
                                                                                                                                                                                                                                                                       63 GIVDFKGELAMRNIEARGLKOMKROGDANVKGEEGIVKAHLLIGVHDDIVSMEYDLAYKL 122
                                                                                                                                                                                                                                                                                           New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                          62

that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound tor identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating compained and a pharmaceutical composition comprising the one or more complained by a pharmaceutical composition comprising the one or more complained by a compound that modulates its activity is useful for preparing a medicament for treating complained in each of a spane near the polymucleotide or the compound that complained by a compound that modulates its activity is useful for preparing a medicament for treating construction injury (CCI) and spared nerve injury (CMI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
```

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

```
comprising the vertation of the mucleic acid sequence lated rate derivative or allelic variation of the mucleic acid sequence. Also derivative or allelic variation of the mucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide, a host cell comprising the vector, a mathod for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a that increases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal composition of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain the specification, a method for identifying a compound useful in treating pain decreases or their antibodies. The polynucleotides or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (CMI) in an animal (e.g. gene the sequence presented is a human protein (shown in Table 2 of the specification, but was obtained in electronic form directly from WIPO at the squence date for this patent did not form part of the printed spared nerve injury (expressed during pain. Note:

The sequence date for this patent did not form pair of the printed space of the printed space of the compound that the sequence of the compound that the sequence date for this spatent did not form pair of the sp
                                                                                                                          invention discloses a composition comprising two or more isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, pain, neuronal tissue, gene therapy,

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, and an allello variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a chart increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound that regulates the activity of one or more of the polymetication, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the compound that matibodiaes. The polymetice or the compound that compliants its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal segmental nerve injury (SNI)) in an animal (e.g. spinal percention) which is differentially expressed during pain. Once: the sequence data for this patent did not form part of the printed compound. The sequence data for this patent did not form part of the printed composition the pactification, but was obtained in electronic form directly from wipo int/pub/published_pot_general compound the decrease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               63 GIVDFKGELAMRNIBARGLKOMKROGDANVKGEEGIVKAHLLIGVHDDIVSMEYDLAYKL 122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     18 DPIHYDKITEEINKAIDDAIAAIEQSETI-------DPMKVPDHAD-KFERHV

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, or human polymucleotides or a polymucleotide acid sequence. Also claimed are a vector, a method for identifying a nucleotide, a host cell comprising the wortor, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound for identifying a compound or small molecule that regulates the activity of one or more of the regulates the cutyity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the specification, a method for identifying a compound useful in treating colypeptides or their antibodies. The polymucleotide or the compound that not injury (CCI) and spared nerve injury (CNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form darry from ground is specification, but was obtained in electronic form directly from WIPO at the polymounic form directly from will part in the did not form part of the printed sequence.

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, or human polymucleotides or a polymucleotide, as degrance. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a array, a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound cfor identifying a compound or small molecule that regulates the activity of one or more of the regulates the contivity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more computates its activity is useful for preparing a medicament for treating complypeptides or their antibodies. The polymucleotide or the compound that complying the expressed during pain. Note: the specification, but was obtained in electronic form directly from WIPO at expensive the published pot\_sequence of sequences.

```
pain and a paramaceutical composition comprising the one or more pain and a pharmaceutical composition comprising the one or more polygeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction tinjury (CXI) and spared nerve injury (SNI) in an animal (e.g. gene the specification) which is differentially expressed during pain. Note: The sequence date for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                            131

```

This sequence is 52 kD human FKSD6 binding protein, referred to as FKBP52, of the invention. The FKBP52 protein plays a key role in regulating immune responses. FKBP52 may be useful for mediating steroid hormone receptor transformation. The DNA may be used to screen for new immunosuppressants, and in assays for metabolites in samples from

The method comprises comparing the level of expression of a marker (gene/polypeptide see ACC50076 to ACC50334 and ABR47386 to ABR47632) in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the marker in the patient is patient sample and the normal level is an indication that the patient is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comparing the level of expression
individuals taking immunosuppressants. The DNA may also be used in assays for identifying natural intracellular rapamycin-like or FK506 like substances, and in assays for identifying natural intracellular substrates that are potential targets for other immunosuppressants

                                                                                                                                                                                                                                                              63 GIVDFKGELAMRNIEARGLKQMKRQGDANVKGEEGIVKAHLLIGVHDDIVSMEYDLAYKL 122
                                                                                                                                                                                                                                                                                The invention describes a transformant containing an antibody gene and a gene encoding a Peptidyl prolyl isomerase (PPIase) having chaperone-like activity. The methods detailed using the transformant are useful for the preparation of a monoclonal antibody. This is the amino acid sequence of a protein associated with the method of preparing a monoclonal antibody described in the invention
afflicted with breast cancer. The breast cancer associated sequences from the present invention have cytostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ця

This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnostic assays. The sequences are useful for the detection or diagnostic assays. The sequences are useful for the detection or expression of the protein or polypeptide are useful in the function or expression of the protein or polypeptide are useful in medical compositions in the treatment or polypeptide are useful in medical compositions in the treatment or prophylaxis of S. pneumoniae infection. As the sequences can be used to treat by neumoniae infection, they can be used to treat bacterial pneumonia, which has high rates in young children, the elderly, and in patients with predisposing conditions or with immunosuppressive disorders, especially AIDS. They can also be used to treat pneumococcal septicaemia, otitis media, sinusitis, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A new nucleotide is described which encodes a 436 residue Streptococcus pneumoniae yphc (GTP binding protein). The DNA sequence can be used to transform a host cell to produce the protein and the products can be used to treat bacterial infections (especially Streptococcus pneumoniae infections, and Helicobacter pylori infections), otitis media, emplyema, and endocardiae, bacteraemia, meningitis, sinusitis, pleural empyema, and endocarditis. The encoded protein and its peptide fragments can be used to generate antibodies

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a protein comprising or having at least 50% identify to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2469 identified DNA coding regions from the expressed from 2469 of 2469 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, creating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the conclete acid cited above or fragments between mucleotides 8-100 of a sequence not defined in the specification, for amplifying a target sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence and where the parts of the primers having the target sequence to the target sequence and where the parts of the primers having the target sequence to be amplified, assay comprising contacting a test compound with the contain and a Streptococcus pneumoniae bacterium, where one or more genes
                                                                                                                                                                                New proteins and nucleic acid molecules from Streptococcus pneumoniae, useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, such as pneumonia, sepsis, otitis media or

encoding the proteins has been rendered inactive. The proteins, nucleic acid molecules, antibody and compositions are useful as medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, outitis media or ear infection. They are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful for identifying immunodominant proteins. The present sequence is one of the 2469 proteins expressed by the identified coding regions from the genomic sequence. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.inf/pub/published_pot_sequences. (Updated on 23-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LGDLHPTTHV-----ISDIQDFVVALSLEISDEGNITMTSFEVRQFANV-----VNHIGGL 172

the 613 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for compound that inhibits or required for the proliferation or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibibite proliferation of an organism acts; (9) manufacturing an antibibite proliferation of an organism acts; (9) manufacturing an antibibite; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to proliferation of an organism. The attiens or collection of an organism. The attiens modeled acids are useful for identifying proteins or screening for homologous mucleic acids required for proliferation in cells other than S. aureus, S. typimurium, C. the target prokaryotic essential genes. Note: The sequence is encoded by one of the target proxaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at the sequences.
                                                                             The invention relates to an isolated nucleic acid comprising any one of

The invention relates to an isolated mucleic acid comprising any one of the 613 antisense sequences given in the specification where expression of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense mucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide whose expression is inhibited by the antisense mucleic acid; (4) an antibody expable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid; (4) an antibody expable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation; (7) identifying a compound that influences the activity of a gene in an operon required for proliferation or that the activity against a biological pathway required for proliferation or that inhibits cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) prolification of an organism acts; (9) manufacturing an antibiotic; (10) prolification of an organism acts; (1) a culture comprising strains in which the gene product is overexpressed, or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of proliferation of an organism. The antisense mucleic acids required for cellular proliferation to isolate candidate molecules for rational corrange discovery programs, or for screening for homologous mucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. acruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO et Ergentense
                                                                                                                                                                                                                                                                                                                                                                                                          screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   148

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of $403 sequences (G1), given in the specification. The proteins have antibacterial and antihilammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a streptococcus that is prevented or ancleic acid encoding (I). A composition comprising (I) or a nucleic acid encoding (I) may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                         : : : : | | | | : : : : : | | 269 NLTDLQQEAYQRYKWGPKETINTIQNLYERHKVLTYPRTDSNYLTDDMVDTIKERLYALL 328
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptococcus, GAS, GBS, group B streptococcus, Streptococcus agalactiae, group A streptococcus, Streptococcus pyogenes, antibacterial, antiinflammatory, infection, vaccine, meningitis, gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein.

Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antisense; prokaryotic essential gene; cell proliferation; drug design.

proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits broliferation and inhibits proliferation; (8) identifying a gene required for callular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound, s activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the twhich is proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational for cellular proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence date for this pattent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed for proliferation from Engene prokaryotic sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of

The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yegurt and cheese. Note: The sequence data for this patent is based on equivalent patent w0200177334 (published 18-CTT-2001) which is available in electronic format directly from WIPO at the buble of the production of yegure and transmitted in the production of yegure and patent w020017734 (published 18-CTT-2001) which is available in transmitted in the production of yegure and transmitted in the production of yegure and patent w1000 into the production of yegure and the patent is based on equivalent betwood into the production of yegure and the production of yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure and yegure 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1256 GLAQDBTALVGEEGFBLAH-HPSRGIFAVGQQGPEIRNLKAGTSILPHSMSKE-FLSLT- 1312

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ठे
                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of the invention relates to an isolated nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid inhibites proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid operation of the nucleic acid of the superation is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity, (11) a culture comprising strains in which the test compound that inhibits the proliferation of an ordanism; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for the collular proliferation of an organism. The antisense nucleic acids are useful for the collular proliferation of an organism. The antisense nucleic acids required for a cellular proliferation of an organism or soreening for homologous nucleic acids required for a cellular proliferation of an organism. The antisense nucleic acids are useful for a cellular proliferation of an organism are proliferation of an organism are proposed and a conference or cellular proliferation of an organism of solutions.
                                                                         New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              52 PDHADKFERHVGIVDFKGELAMRNIEARGLKQMKRQGDA-----NVKGEEGIVKAHLLI 105

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas acruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets for antibiocis development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the express these proteins, and to obtain antibodies capable of binding to the express discovery programmes. The be used to screen compounds in rational drug discovery programmes. The antibodies caids which are required for cell proliferation in a wide variety of organisms. The present sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The printed sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 354 IFSLLMIALVSFVAMAMFGNKYEETPDVIGKSVKEA----EQIFNKONLKLGKISRSYSD 409

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ਨੇ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, pseudomonas actriginosa and Enterococcus faccalls. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The used to screen compounds in rational drug discovery programmes. The be used to screen compounds in rational drug discovery programmes. The nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein. Note: The sequence data for this patent electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ŗ,

```

```
New mycobacterial peptide, useful for the manufacture of a medicament for treating or preventing, or a diagnostic reagent for identifying, mycobacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           mycobacterial (Mycobacterium tuberculosis) proteins which are upregulated under nutrient starving conditions and maintain mycobacterial latency. The DNA and protein sequences of the invention are useful for the treatment, prevention and diagnosis of a mycobacterial infection. The present amino acid sequence represents a Mycobacterium tuberculosis protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         128 LDPAVAAVDALIQATDLKVADVEPLIERYRGRRGMKAARAALDLVDGGAQSPKETWLRLL 187

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides

(II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I)
and (II) can have antibacterial activity and therefore can be used in
vaccination. The mucleic acids (I) may be used to produce the S.

Epidermidis polypeptides (II) via the production of vectors containing
them which are used to produce hosts cells which express the betteria.

Colypeptides. The polypeptides (II) (and/or nucleic acids) may then be
used to vaccinate subjects and to raise antibodies against the bacteria.

The polypeptides may also be used to sasay for other inhibitors of their
activity and therefore identify compounds that may be used for the
treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to
AAH55090 represent specifically claimed S. epidermidis genomic DNA
polynucleotide sequences from the present invention. AAH55091 to AAH55098

represent oligonucleotide sequences and primers which are used in the
sequence listing of the present invention, bowever the sequence
constitution of the present specification, however the sequence
in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present
in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present
                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 18; Page 433; 2188pp; English.

2003-029926/02 N-PSDB; ACA31159 New antisense nucleic acids, useful for identifying proteins or s for homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs.

Claim 25; SEQ ID NO 55213; 1766pp; English.

The invention relates to an isolated mucleic acid comprising any one of the 5213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding antisense nucleic acid; (4) an antibody capable of specifically binding compound that inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation of the biological pathway in which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; as activity; (11) a culture comprising strains in which the gene product is congruing activity; (11) a culture comprising strains in which the extent to which each of the strains is present in a culture or collection of an organism or (13) identifying a present in a culture or collection of an organism or (13) identifying a partience and antibional and antibional and that inhibits the arrivate or compound that inhibits and the product for a particular and the strains in which the compound that inhibits and compound that inhibits the arrivated for a gene or its compound that inhibits and any or the product or collection of an ordinal particular and any ordinal and any ordinal and any ordinal and any ordinal and any ordinal and any ordinal and any ordinal and ordinal any ordinal and ordinal any ordinal any ordinal any ordinal any ordinal any ordinal any ordinal an proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proteins or screening for homologous nucleic acids required drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The invention relates to six novel proteins, termed KIAA0301, G7c, BAA25490.1, AAD21820.1, CAB01991.1 and CAA17374.1, which have been identified as adhesion molecules (also termed AD1-6), their encoding nucleic acids, fragments and functional equivalents. Also included are a vector comprising the nucleic acids, a host cell transformed with the vector, an AD -inhibitory ligand, a compound that either increases or decreases the level of expression or activity of the AD protein, a vaccine comprising the procein or nucleic acid, a method for the identification of a compound that is effective in the treatment and/or identification of a compound that is effective in the treatment and/or diagnosis of disease, comprising contacting AD or its nucleic acid with one or more compounds suspected of possessing binding affinity for the polypeptide or nucleic acid molecule, and selecting a compound that binds to obyte or compound are useful in therapy or diagnosis of disease such as a cardiovascular disease (including atherosclerosis, ischaemia,

The present invention relates to nucleic acid molecules designated monogenic audiogenic seizure-susceptible-1 (mass1) genes. The nucleic acid molecule may be used via recombinant DNA methodologies in the production of transgenic animal (especially mouse) models for studying
    (mass1) genes, useful for
Monogenic Audiogenic Seizure-Susceptible-1 (mas
producing animal models of audiogenic seizures.
                                                                                                                           Claim 19; Fig 6; 79pp; English.

The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB5300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and patent woolou77314 (published 18-05017) which is available in electronic format directly from WIPO at the Updated on 29-AUG-2003 to ftp.wipo.int/pub/published_pct_sequences. Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in
                                                                                                                                                                                                                                                                                                                          12;
ball, ACAI and Ip90 (see also AAR35437-39). These strains of B. burgdorferi are representatives of the three classes of B. burgdorferi species, class I, II and III. The immunogenic peptides may also be used in vaccines to protect against Lyme disease. This sequence is represented as it is given in the specification. It was not derived from the corresponding DNA sequence. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           44 ETIDPMKVPDHADKFERHVGIVDFKGELAMRNIEARGLKOMKROGDANVKGEEGIVKAHL 103
